VIMP Update

With the menu item "VIMP Update" you can update your VIMP installation to a new version from the administration interface.

Upload the updater (vimp.framework-X.X.X-rXXXXX--updater.bin), which you get provided in your account on the VIMP support page, first.

After the file has been checked and you have optionally specified whether the backup should be omitted and whether the update file should be deleted after the update, start the update by clicking on the "Start update" button.

Normally, the update completes with a success message. In case of an error, you will receive corresponding messages in the update log.

If an update fails, you can select and restore a previous backup afterwards.

With the VIMP update function you can update VIMP as well as additionally installed modules or extensions.

The first installation of new modules or extensions, however, must be done on the console.

() ATTENTION:

Custom changes to the code or in the templates are overwritten with each update and must then be manually re-entered by you.

We assume no liability for any loss of data.
